How does the scoring work?

Say you have an inspection with a **32 total** of **items** observed, **29 positive** observations and **3 negative** observations. If you divide **29 positive** by **32 total** you will get **.90625** and with decimals moved, you get a score of **90.6%**(positive).

Another example: **30** observations, **28 positive** and **2 negative**, the score would equal: **93.3%.**
If you add a **Severity Rating** of **Serious (deducts 5 points)** to **one** of the **2 negative** observations the score would be **88.3% (93.3% - 5 points)**. For the other **negative** observation, you rate it at **Critical**, this deducts **10 points** and the score would be **78.3% (88.3% – 10 points).**
